Vistamatic[®]Max
The Panel with Better Vision

VISTAMATIC® MAX

Max Vision vs Standard Vision, what's the difference? Put simply, it's the visibility and observation aspect.

All Vistamatic® glazed secure vision panels incorporate the unique Integrated Spindle Cam Mechanism (Patent No. 2491218) this being the critical moving part of the observation panel assisting in the lift and fall of the central pane of glass.

This mechanism is available in two optional sizes, Standard and Max. The original Standard Vision offers a viewing perspective of 9mm through the open aspect of this multiple linear design. This tried and tested product has for more than 40 years set the standard for glazed secure vision panels in offering superb monitoring benefits within the Healthcare sector.

The new Max Vision offers an enlarged viewing aspect that more than doubles the vista of the Standard panel through an enlarged multiple linear design whilst demonstrating the appearance of a venetian blind. The viewing aspect on the Max is increased to more than 25mm providing a unique and exceptional perspective improving the observation and monitoring benefits to service users.

Our Integrated Spindle Cam Mechanism is at the heart of every Vistamatic® allowing us to confidently offer a Lifetime Warranty* on all vision panels.

DOOR OR WALL HOUSING

STANDARD PANEL THICKNESS 18mm

For full range of glasses please visit our website.

Complies with the Department of Health environmental design principles for adult medium secure units and beyond.

According to Department of Health guidelines;

All doors in patient accessible areas should be fitted with either vision panels or, if the door is within a screen, adjacent glazed panels should be fitted.

Consideration should also be given to the need for vision panels in internal subdivisions, partitions and doorways.

To reduce the risk of failure under attack, vision panels should be constructed with metal surrounds that can be securely fixed into the opening in the door.
